1. Release

RELEASE NUMBER	1.2.0	
TYPE		
APPLICATION	Vaccination	
VERSION		
DATE ACCEPTATION	08/03/2021	
DATE PRODUCTION	09/03/2021	

API Documentation

- ACC : <https://portal-acpt.api.ehealth.fgov.be/>
- PROD : <https://portal.api.ehealth.fgov.be/>

2. Updated features

2.1. API modifications

2.1.1. Get person

The flag « eBox activated » is added in the response.

2.1.2. Person first name

If a person has « 000000 » as first name, the API doesn't return this information.

2.1.3. Electronic contact data source

It is now possible to delete the email and the gsm number thanks to two new methods (« bulkPersonsContactDataDeleteEmail » and « bulkPersonsContactDataDeleteGsm »).

A delete is only possible when the source in the database is the same as the source making the delete request. The reservation tool can delete the gsm number or the email even if this information comes from another source. Indeed, this request comes directly from the person concerned.

2.1.4. Search notifications

New method for the reservation tool to get all notifications that have been created from a certain timestamp to another one. This method will help the synchronization between the reservation tool database and vaccination database.

2.2. Business rules modifications

2.2.1. House number

If the house number has leading zeros, we delete these and return only the real number.

2.2.2. Electronic contact data source

The vaccination database stores now the source of each electronic contact data (gsm number and email). As explained in the previous point, we have added two methods to delete the gsm number or the email.

2.2.3. List schedulable vaccinations

When this method is called, if we have less than 5000 schedulable vaccinations, this method calls automatically « activateByOldest » to activate 1000 people. Thanks to that, there are always people to invite.

2.3. Swagger improvements

2.3.1. Possible status code 204

We have added in the swagger that the API can return a status code 204 for requests returning no content.

2.3.2. Consult business events

A better description of the two possible ways to use this method is available. The swagger describes what returns the method when we use a doctor's nihii or a patient's ssin.
